edunet foundation

Cancer Cell Classification Using Scikit-learn

Program Feedback

It was a great session. I learned many things. It was knowledgeable and interesting. I had hands on experience with IBM Cloud and associated tools such as IBM WatsonX Assistant. I even got access to IBM Cloud without any credit card. Thank you to edunet and IBM for this opportunity.

Project Short Summary

My project aims to develop a machine learning model using Scikit-learn to accurately classify cancer cells from complex imaging data. By addressing the limitations of manual analysis and traditional methods, this model seeks to enhance the efficiency and reliability of cancer cell classification, supporting precise and timely medical decisions for effective diagnosis and treatment.
